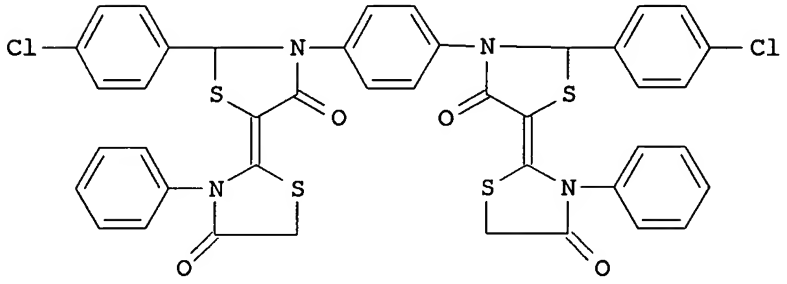
I



II

AB P-Bis(4-thiazolidinon-3-yl)phenylenes, e.g., I and II, were synthesized by cycloaddn. of thioglycolic acid with Schiff bases of p-phenylenediamine or by treatment of p-bis(thioureido)phenylenes with Et chloroacetate. Reactions of hydrazines, hydroxylamine, acetamidine and N-phenylthiourea with I and II were reported. Some of the new compds. were tested for their effect on cellobiase, produced by thermophilic fungi.

AB Polyamides and polyesters containing azomethyne linkages were prepared by condensation from thioamide monomers and acid chlorides and from Schiff's bases and terephthalic acid chloride and isophthalic acid chloride, resp. The elec. conductivity of the resulting conducting polymers was studied using simple PPP [PPP] calcns. and exptl. measurements. The UV spectra of monomers and polymers indicate π - π^* transitions, however, no correlation could be obtained of this transition and conductivity A reasonably good correlations was obtained between the conductivity of the polymers and the frontier electron d. at the C* atom, from the LUMO [LUMO] and the next higher unoccupied orbital of the repeating unit. Upon doping with Ag, the elec. conductivity all polymers increased significantly, which is attributed to contributions of all unoccupied orbitals of adjacent repeating units to the C* atom.

AB A new series of thiocarbamides was prepared by the reaction of benzoylisothiocyanate with 2-aminopyridine, 3-aminopyridine, 2,3-diaminopyridine, 2,6-diaminopyridine, o-phenylenediamine, p-phenylenediamine, and ethylenediamine. The Cu(II) complexes of these ligands were isolated and characterized by elemental analyses, molar conductivities, magnetic moments and spectral (visible, IR) measurements. IR spectra show that the ligands behave as dianionic or neutral tetradentates or as monoanionic, or neutral bidentates. [Cu(HL)Cl]2 (H2L = RNHCSNHBz (R = 2-pyridyl)) and Cu(H2L1)Cl2 (H2L1 = R1(NHCSNHBz)2 (R1 = 2,6-pyridinediyl) are diamagnetic and the other complexes have normal magnetic moment at room temperature Electronic spectral analyses show that Cu2(L1)(OAc)2 is planar and the other complexes are tetragonally distorted octahedral. All the complexes are nonelectrolytes.

AB ML(SCN)2 [M = Co, Ni, L = BzNHC(S)NH(CH2)2NHC(S)NHBz, o-C6H4(NHC(S)NHPh)2; m = Ni, L = o- and p-C6H4(NHC(S)NHBz)2] were prepared The complexes were characterized by molar conductivity and magnetic moment data, IR and electronic spectra and thermal anal. The ligands coordinate through the S atoms. Ligand field parameters were calculated The Ni complexes are octahedral and the Co complexes are 4 coordinate.

AB By sym. linking of 2 bidentate N-acylthioureas 2 types of quadridentate bis-N-acylthioureas are available which act, after di-deprotonation as bis-bidentate S, O ligands towards polyvalent metal ions. They can form oligomeric or polymeric, cyclic or chain chelates. With 1,1,1',1'-tetraalkyl-3,3'-terephthaloylbisthioureas (H2L) oligomeric triangulo-trimetallamacrocycles Ni3L3 and Cu3L3 were obtained. They contain perimetric 27-membered rings, counting the internal oxygens, or 39-membered rings with the external S atoms on the other hand, i.e. equal chalcogen atoms are in cis-positions within each chelate unit around the 3 metal ions. The trimetallamacrocyclic structure was proved by x-ray crystal and mol. structure anal. of Ni3L3 (alkyl = Et) or EPR of the corresponding Cu3L3. Diamine-linked bis-N-acylthioureas form insol. 1:1 polymeric chelates.

AB MLX2 (M = Cu, Ni, Co; L = BzNHC(S)NHC6H4NHC(S)NHBz-p, X = Cl, Br, NO3, ClO4) were prepared and characterized on the basis of IR spectral, electronic spectra and magnetic susceptibility measurements. IR spectra manifest the coordinates of the ligand to the metal ion through carbonyl O and thiocarbonyl S atoms. The complexes possess octahedral stereochem. as inferred from electronic spectral data and magnetic moment values. Fungicidal screening of the complexes shows them to be antifungal against Aspergellus niger, Fusarium oxysporium and Helminthosporium oryzae.

AB Isophthaloyl diisothiocyanate (I) is polymerized with aromatic diamines in amide solns. to give polymers having reduced viscosity ≤1.39 dL/g (30°, 0.5 g/dL in Me2NAc containing 5% LiCl), or I is polymerized with aliphatic diamines by interfacial methods using aromatic solvents to give polymers having reduced viscosity up to 1.21 dL/g. Interfacial polymerization of I with aromatic diamines and solution polymerization of I in amide solvents with aliphatic diamines does not give high-mol. weight polymers. The poly(acylthioureas) lose 5% weight in N or air at 210-20°.

AB The known 6,2-I(H2N)C6H3CO2H (I) refluxed 20 hr in ClCO2Et yielded 63% 5-iodo-2H-3,1-benzoxazine-2,4-(1H)-dione (II) (R = H, R1 = 5-I), m. 173.5° (MeOH-C6H6), converted by refluxing 2 hr in concentrated NH4OH to 39% 5-iodo-2,4-(1H,3H)-quinazolinedione (III) (R = H, R1 = 5-I), m. 340°, also produced by heating I 30 min at 170-80° with urea. NH4SCN refluxed in Me2CO with addition of BzCl and the mixture treated with I in Me2CO, refluxed and the cooled solution poured into cold H2O gave 6,2-I(BzNHCSNH)C6H3CO2H (IV), m. 171-3°, converted by refluxing in N NaOH and acidification to 5-iodo-2-thio-2,4(1H,3H)-quinazolinedione (V) (R = H, R1 = 5-I), m. 324-6° (decomposition). The known 3,5,2-ICl(NH2)C6H2CO2H was similarly transformed to give 46% II (R = 6-Cl,

R1 = 8-I), m. 176-8°; 62% III (R = 6-Cl, R1 = 8-I), m. 310° (decomposition), 47% 3,5,2-ICl(BzNHCSNH)C6H2CO2H, m. 181-3°, and 80% V (R = 6-Cl, R1 = 8-I), m. 320-2° (decomposition). Analogous procedures converted 3,5,2-IBr(H2N)C6H2CO2H into 88% II (R = 6-Br, R1 = 8-I), m. 155-7°; 43% III (R = 6-Br, R1 = 8-I), m. 314-16°; 71% acid 3,5,2-IBr(BzNHCSNH)C6H2CO2H, m. 172-4°; and 84% V (R = 6-Br, R1 = 8-I), m. 303-5° (decomposition).

AB cf. CA 64, 5083d. Primary and secondary amines were added to PhCSNCO (I) to yield the corresponding PhCSNHCONRR' (II). PhCSNHCONH2 (III) was obtained by the selective saponification of II (R = Bz, R' = H) (IV). The adducts from hydrazines and amidines to I showed a strong tendency for cyclization. 2-Phenylthiazolidine-4,5-dione (V) (5 g.) in 30 cc. dry methylcyclohexane decomposed thermally by the method described previously gave a solution of I; except where noted otherwise, this solution from 5 g. V was used in all runs with I as the starting material. I treated dropwise with 1.2 g. absolute EtOH yielded 3 g. deep yellow PhCSNHCO2Et, 63° (decomposition) (AcOEt-ligroine). I with 1.92 g. BuNH2 in 5 cc. dry Et2O gave after chromatography on silica gel 0.7 g. PhCN, 1.5 g. PhCSNH2, 0.28 g. II (R = Bu, R' = H), m. 92° (1:15 CH2Cl2-methylcyclohexane), and 2 g. brown, odoriferous oil. I with 2.23 g. piperidine in 25 cc. dry methylcyclohexane stirred 15 min. gave 4.5 g. yellow-orange II [(RR' = (CH2)5] (VI), m. 130° (decomposition) (aqueous EtOH). VI (0.248 g.) in 30 cc. MeOH treated at room temperature with 20 cc. 0.1N AgNO3 gave 0.165 g.

N,N-pentamethylene-N'-benzoylurea, m. 172° (decomposition) (dioxane-ligroine). I and 10 cc. Et2O treated with 2.6 g. cyclohexylamine in 20 cc. Et2O gave 2.9 g. II (R = cyclohexyl, R' = H) (VII), m. 150° (1:2 C6H6-petroleum ether). I with 2.45 g. PhNH2 in 10 cc. dry Et2O stirred 10 min. at room temperature gave 3.0 g. sulfur yellow II (R = Ph, R'= H) (VIII), m. 214° (decomposition) (EtOH). VIII refluxed 0.5 hr. with 0.1N AgNO3-MeOH yielded 88% PhNHCONHBz. 2,3,6-Triphenyl-2H-1,3,5-thiadiazin-4-one (3.44 g.) in 50 cc. dioxane and 1 cc. H2O refluxed 5 min. gave 2.42 g. yellow VIII, m. 216° (decomposition). I (from 3.82 g. V) treated at 0° with 10 cc. dry AcOEt and then slowly with 3.38 g. Ph2NH in 10 cc. dry Me2CO and stirred 0.5 hr. at 0° yielded 30% PhCSNHCONPh2 (IX), m. 137° (decomposition) (petroleum ether). IX (0.332 g.) and 0.138 g. o-O2NC6H4NH2 in 7 cc. dry C6H6 heated 5 min. at 40° and kept at room temperature overnight yielded 0.19 g. II (R = o-O2NC6H4, R' = H) (X). I with 3.23 g. p-MeOC6H4NH2 in 30 cc. dry Me2CO yielded 4.84 g. bright yellow II (R = p-MeOC6H4, R' = H) (XI), m. 179° (decomposition). XI decomposed at about 200° with gas evolution and formation of a colorless solid, m. 230°. XI (1 g.), 0.007 mole Et3N, and 25 cc. dry AcOEt treated with stirring at about 10° with 0.56 g. Br in 25 cc. dry AcOEt gave 0.5 g. light yellow XII (R = p-MeOC6H4), m. 155° (AcOEt). I with 3.62 g. o-O2NC6H4NH2 in 15 cc. dry Me2CO yielded 3.15 g. light brown-yellow X, m. 215° (decomposition) (C6H6). I and 4.6 g. 2,4-(O2N)2C6H3NH2 refluxed 1 hr. in 30 cc. dry Me2CO and stirred 20 min. yielded 0.9 g. II [R = 2,4-(O2N)2C6H3, R' = H], m. 225° (decomposition) (200:25 dioxane-H2O). I from 0.95 g. V treated dropwise with 0.59 g. p-H2NC6H4CN in 10 cc. absolute Me2CO and stirred 10 min. yielded 0.68 g. deep yellow II (R = p-NCC6H4, R' = H), m. 252° (decomposition) (PHCl). I from 1.91 g. V with 1.52 g. o-H2NC6H4CSNH2 in 10 cc. dry Me2CO gave 2.25 g. II (R = o-H2NCSC6H4, R' = H) (XIII), m. 198° (decomposition with formation of light yellow and red crystals). I from 1.9 g. V stirred 15 min. with 0.54 g. p-C6H4(NH2)2 in 10 cc. dry tetrahydrofuran yielded 1.05 g. yellow p-PhCSNHCONHC6H4NHCONHCSPh, decompose above 223° with the evolution of gas but without melting. I and 2.47 g. 2-aminopyridine in 15 cc. dry Me2CO stirred 15 min. gave 3.1 g. yellow II (R = 2-pridyl, R' = H), m 199° (decomposition)(AcOEt), which refluxed 4 hrs. with aqueous dioxane. gave a S-free solid, m. 211° (decomposition). I with 2.5 g. 2-aminopyrimidine in 30 cc. dry Me2CO gave similarly 4.5 g. pink II (R = 2-pyrimidinyl, R' = H), m. 238° (decomposition) (HCONMe2). I with 4.65 g. 5-amino-3-phenyl-1,2,4-thiadiazole in 30 cc. dry Me2CO stirred 15 min. gave 5.2 g. yellow II (R = 3-phenyl-1,2,4-thiadiazol-5-yl, R' = H), m. 252° (decomposition) (HCONMe2-tetrahydrofuran), which repptd. from AcNMe2 with petroleum ether gave orange prisms which change above 80° to the yellow form. I with 3.2 g. BzNH2 and 20 cc. dry Me2CO gave 1.3 g. IV, pink needles from C6H6, violet needles from Me2CO, m. 220° (decomposition). PhCSNH2 (46 g.) in 400 cc. dry C6H6 refluxed 3 hrs. with 49 g. BzNCO yielded 80 g. IV. 2,6-Diphenyl-1,3,5-thiadiazin-4-one (0.266 g.) in 5 cc. Me2CO heated briefly to 40° with a few drops H2O and 1 drop 2N HCl and kept 0.5 hr. at room temperature gave 0.27 g. IV. I and 3.6 g. BzNHNH2 in 25 cc. Me2CO yielded 2.6 g. yellow II (R = BzNH, R' = H) (XIV), m. 226° (decomposition) (C6H6). I from 2.5 g. V stirred 0.5 hr. with 1.57 g. PhCH:NNH2 in 10 cc. dry Me2CO yielded 0.82 g. light yellow II (R = PhCH:N, R' = H), m. 175° (decomposition). V (5 g.) and 4.0 g. H2NCH2CO2Et.HCl refluxed in methylcyclohexane gave 2.5 g. yellow PhCSNHCONHCH2CO2Et (XV), m. 138° (decomposition) (MeOH). XV (1 g.) and 10 cc. 4N NaOH heated about 10 min. at 40° and neutralized gave 0.85 g. light yellow PhCSNHCONHCH2CO2H, m. 258° with foaming (aqueous MeOH); it crystallized from aqueous MeOH with 0.5 mole H2O. I from 2.5 g. V

with 0.66 g. N2H4.H2O in 15 cc. dry tetrahydrofuran yielded 1.2 g. yellowish XVI (R = R' = H) (XVII), m. 321° (aqueous EtOH). XIV (0.3 g.) and 1 drop Me2CO in 5 cc. 4N NaOH refluxed 10 min. and neutralized gave 0.15 g. XVII, m. 320-4°. I with 2.9 g. PhNHNH2 in 5 cc. dry Et2O at -20° gave 2.23 g. yellow precipitate which heated in AcOH gave with the elimination of H2S a mixture of XVI (R = Ph, R' = H) (XVIII) and XVI (R = H, R' = Ph) (XXIX) which fractionally recrystd. from aqueous AcOH gave 1.66 g. XIX, m. 235°, and 0.1-0.2 g. XVIII, m. 278° (partial decomposition). I from 1.91 g. V in 20 cc. methylcyclohexane refluxed 15 min. with 1.84 g. (PhNH)2 in 10 cc. absolute tetrahydrofuran gave 0.86 g. XVI (R = R' = Ph), m. 242° (decomposition) (EtOH). I with 3.2 g. PhC(:NH)NH2 in 20 cc. dry Me2CO refluxed 5 min. yielded 2.1 g. PhC(:NH)N:CPhNHCONHC(:NH)Ph (XX), m. 240-4° (decomposition) (AcNMe2-AcOEt). XX (about 0.5 g.) fused gave with the evolution of PhCN and NH3 2,6-diphenyl-3,4-dihydro-1,3,5-triazin-4-one, m. 289° (C6H6N). I in 25 cc. methylcyclohexane with 5 g. PhC(:NH).NHPh in 20 cc. dry dioxane gave 2.4 g. 1,2,6-triphenyl-1,4-dihydro-1,3,5-triazin-4-one, m. 284° (decomposition) (tetrahydrofuran) with the formation of a solid, m. 232° with sublimation. XIII (0.78 g.) in 4 cc. dry Me2CO and 0.32 g. (COCl)2 in 10 cc. dry Me2CO gave at about 70° 0.63 g. red XXI, m. 163° (decomposition). IV (56.8 g.) in 100 cc. Me2CO and 2 l. 2N NaOH shaken 14 hrs. at room temperature and neutralized with AcOH yielded 30-1 g. lemon yellow III, m. 190° (decomposition) (AcOEt-ligroine). III (1.8 g.) in 10 cc. 2N NaOH treated gradually with 1.3 cc. 30% H2O2 gave XII (R = H), m. 204° (MeOH); it gives a blood red color with FeCl3-MeOH).

AB cf. Sci. Sinica (Peking) 12, 143(1963); CA 52, 19993b. Bis(acyl isothiocyanates) reacted readily with diamines to form linear polymers of acylthioureas with the structure [R'NHCSNHCORCONHCSNH]n. Ten such poly(acylthioureas) were synthesized by the reactions of adipic, azelaic, and terephthalic diisothiocyanates with hydrazine, ethylenediamine, H2N(CH2)6NH, p-phenylenediamine, and benzidine. The structure of the

polymers obtained was confirmed by elementary analysis, degradation examination, and uv and ir spectroscopy. These polymers were colored (yellow to orange) powders, sparingly soluble in common organic solvents, but readily soluble in HCONMe2 and cold concentrated H2SO4. The x-ray diffraction patterns showed that these polymers possessed fair crystallinity. The softening points of the polymers decreased with increasing length of the aliphatic C chain and increased when benzene nuclei were introduced into the chain. Four of these polymers had softening points >300°.

AB Diisothiocyanates of formula R(CONCS)2 (from diacyl chlorides and 2 moles NH4CNS) can add 2 moles of a primary amine, R'NH2, to form bis(acylthioureas), (R'NHCSNHCO)2R. For R' = Ph and R given, the m.ps. are: (CH2)4, 192-3°; p-C6H4 (I), 290°. If RCONCS (from RCOCl and 1 mole NH4CNS) was treated with diamines, R'(NH2)2, bis(acylthio-ureas) of type (RCONHCSNH)2R' were formed; e.g. for R =Ph and R' given, the m.ps. are: (CH2)6, 177-8°; p-C6H4, 237-8°. By hydrolysis with 10% NaOH, 80-90% of the original carboxylic acid and thiourea were recovered and identified by mixed-m.p. determination By keeping bis(acyl isothiocyanates) (3 kinds) and diamines (5 kinds) for 12 hrs. in anhydrous Me2CO, 10 poly(acyl-thioureas) were obtained containing the fundamental unit R'NH-CSNHCORCONHCSNH (R, R', m.p., and reduced viscosity at 30 ± 1° in 0.5 g./ml. concentrated H2SO4 given): (CH2)4, (CH2)2, 185° (decompose), 0.10; (CH2)4, (CH2)6, 180° (decompose), 0.18 (infrared absorption bands at 5.58-6.1, 6.3-6.65, 7.8-8.0, 8.6, and 13.58 μ); (CH2)7, (CH2), 125-9°, 0.10; (CH2)4, p-C6H4, m. >300°, 0, 20 (infrared absorption bands at 2-15 μ; ultra-violet absorption similar to that of I); (CH2)7, p-C6H4, 150-3°, 0.16; p-C6H4, -, m. >300°, 0.069; p-C6H4, (CH2)2, 210° (decompose), 0.12; p-C6H4, (CH2)6, 120-5°, 0.12; p-C6H4, p-C6H4, m.>300°, 0.11; and p-C6H4, p-C6H4C6H4, m.>300°, 0.13. The x-ray diagrams for most of the polymers indicate a crystalline state of linear order. The polymers are yellow or orange powders, insol. in most organic solvents, but

readily soluble in HCONMe2 or concentrated H2SO4. Introduction of a benzene ring raises the softening point. The dielec. constant ranges from 1010 to 1011 ohm-cm.

AB The reaction of phosgene with the appropriate amines was used to prepare the following isocyanates of cymene (substituents, b.p./mm., m.p., nD (t), and % yield given): 2-OCN, 76-7°/1, -, 1.5205 (22°), 70; 3-NCO, 76-7°/1, -, 1.5190 (22°), 60; 6-NO2, 2-NCO, 120-3°/1, 75°, 1.5425 (55°), 50; 2,6-(NCO)2 123-6°/2, 52-3°, 1.5517 (55°), 89; 2,5(NCO)2, 125-6°/2, 46-7°, 1.5394 (55°), 65; 3,5-(NCO)2, 110-12°/2, -, -, 81. The p-tolyl-, benzoyl-, phenylureas, and some of the methyl- and ethylurethans were prepared 2,3-Diamino-p-cymene (15 g.) in 300 ml. o-Cl2C6H4 treated with COCl2 several hrs., the mixture distilled, and cooled yielded 2-hydroxy-4-methyl-7-isopropylbenzimidazole, m. 260-1°, which with PCl5 yielded the 2-Cl derivative, m. 237-8°.

AB Using a focused screening approach, acyl ureas have been discovered as a new class of inhibitors of human liver glycogen phosphorylase (hlGPa). The x-ray structure of screening hit 1 (IC50 = 2 μM) in a complex with rabbit muscle glycogen phosphorylase b reveals that 1 binds at the AMP site, the main allosteric effector site of the dimeric enzyme. A first cycle of chemical optimization supported by x-ray structural data yielded derivative 21, which inhibited hlGPa with an IC50 of 23±1 nM, but showed only moderate cellular activity in isolated rat hepatocytes (IC50 = 6.2 μM). Further optimization was guided by (i) a 3D pharmacophore model that was derived from a training set of 24 compds. and revealed the key chemical features for the biol. activity and (ii) the 1.9 Å crystal structure of 21 in complex with hlGPa. A second set of compds. was synthesized and led to 42 with improved cellular activity (hlGPa IC50 = 53±1 nM; hepatocyte IC50 = 380 nM). Administration of 42 to anesthetized Wistar rats caused a significant reduction of the glucagon-induced hyperglycemic peak. These findings are consistent with the inhibition of hepatic glycogenolysis and support the use of acyl ureas for the treatment of type 2 diabetes.

AB Title compds. I [W, X, Y = O, S; R9, R10, R11, R12 = H, halo, OH, etc.; R1, R2 = H, (un)substituted alkyl; R3, R4, R5, R6 = H, halo, OH, etc.; R7 = H, (un)substituted alkyl, e.g., OR13, NR14R15, etc.; R8 = NR18R19, OR20; R13 = H, alkyl, alkenyl, etc.; R14, R15 = H, (un)substituted alkyl; R18, R19 = H, alkyl, alkenyl, etc.; R20 = alkyl, alkenyl, alkynyl, etc.] and their pharmaceutically acceptable salts were prepared For example, condensation of benzamine II (Z= H), e.g., prepared from 2-chloro-4-fluorobenzamide in 2-steps, and carbonochloridic acid Me ester afforded benzamide II (Z = COMe) in 55% yield. In glycogenphosphorylase-A (GPa) inhibition assays, 23-examples of compds. I, at 10 μM, exhibited 48-100% inhibition of GPa activity, e.g., benzamide II (Z = COMe) displayed 53% enzyme inhibition. Compds. I were claimed useful as antidiabetic agents.

AB By the use of solid-liquid phase transfer catalyst, 15 title compds. with diacylthiourea structure were synthesized from substituted aryloxyacetic acid or aromatic acid and aromatic diamine. For example, reaction of 3-MeC6H4CONCS, prepared from 3-methylbenzoic acid, with p-phenylenediamine gave 83% N,N'-[1,4-phenylenebis(iminocarbonothioyl)]bis[3-methylbenzamide]. The test of their biol. activities shows that most compds. have good plant growth regulating activities and a few of them are more active than indoleacetic acid.
